

RPM Connector for Dynamics GP

What's New/February 2023

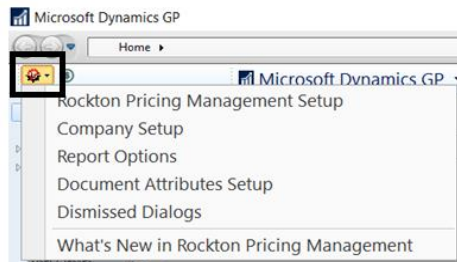

Compatibility Update

RPM Connector has been updated for compatibility with the Microsoft Dynamics GP 18.5.

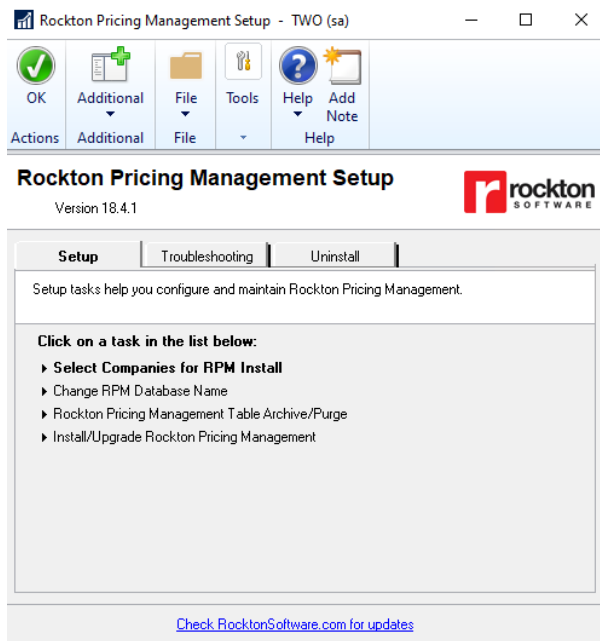

RPM Menu Icon

A new icon appears for the RPM shortcut on the menu bar. This helps differentiate between the other Rockton Software products.

Change RPM Database Name

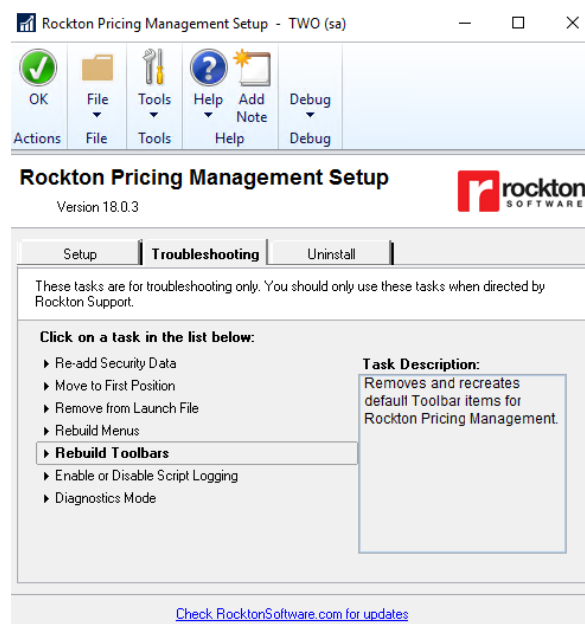

A new option appears in the RPM Company Setup window. This window may be accessed from Microsoft Dynamics GP | Tools | Setup | Rockton Pricing Management | Rockton Pricing Management Setup, or from the RPM shortcut on the menu bar.

You may change the RPM Database. This allows you to change the name of the database from what it was created as originally.

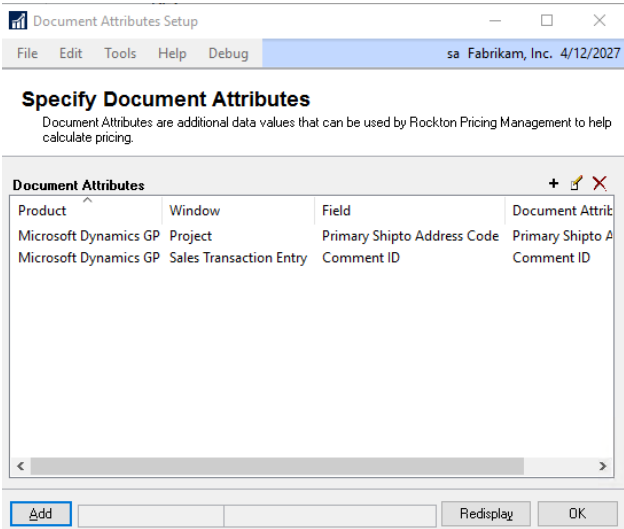

Rebuild Toolbars

You can now rebuild your RPM Toolbars. This feature is available from the Rockton Pricing Management Setup window, under the Troubleshooting tab. When you click Rebuild Toolbars from the menu, the default toolbar is recreated. This is beneficial should the RPM Toolbar not appear.

Document Attributes

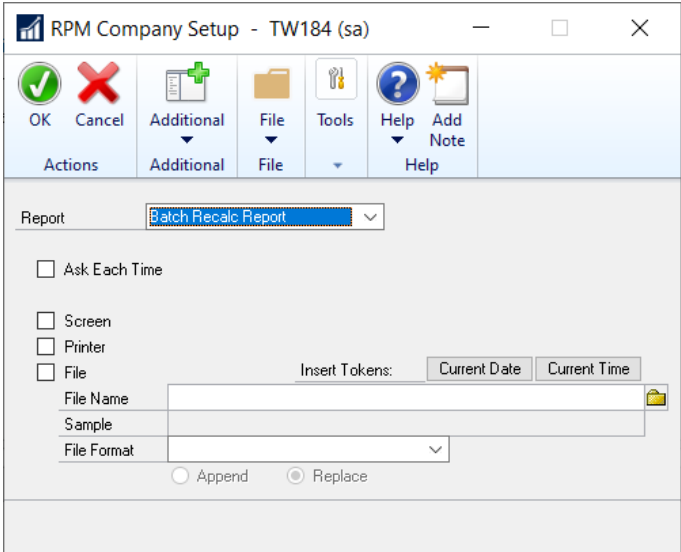

Previously, Document Attributes were hard coded into RPM and specific fields were used. Now, you may choose what Document Attributes you want to include to help drive the calculated price returned from the pricing engine. Use the Document Attributes Setup window to specify the additional fields you wish to pass to RPM.

This window may be accessed from Microsoft Dynamics GP | Tools | Setup | Rockton Pricing Management | Document Attributes Setup, or from the RPM shortcut on the menu bar.

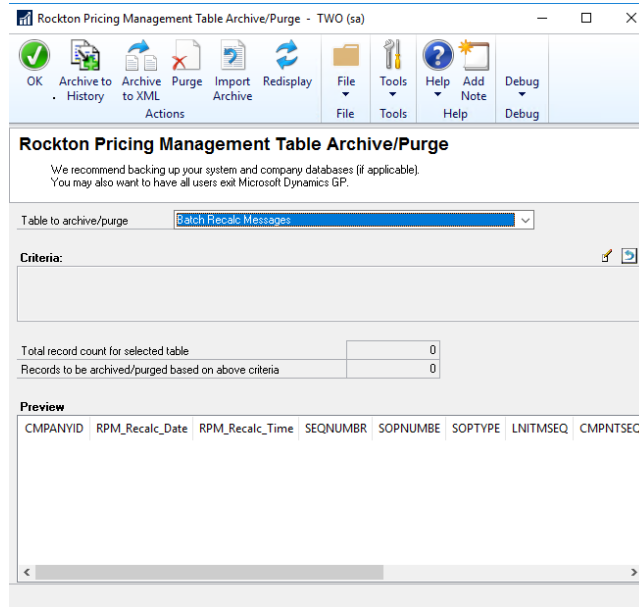

Batch Recalc Report

When you recalculate a batch of transactions from Sales Batches, you now receive a Batch Recalc Report. This provides you with information on what was recalculated. The Report Options window under Microsoft Dynamics GP | Tools | Setup | Rockton Pricing Management | Report Options allows you to set default options for the report. You can also access this window from the RPM shortcut.

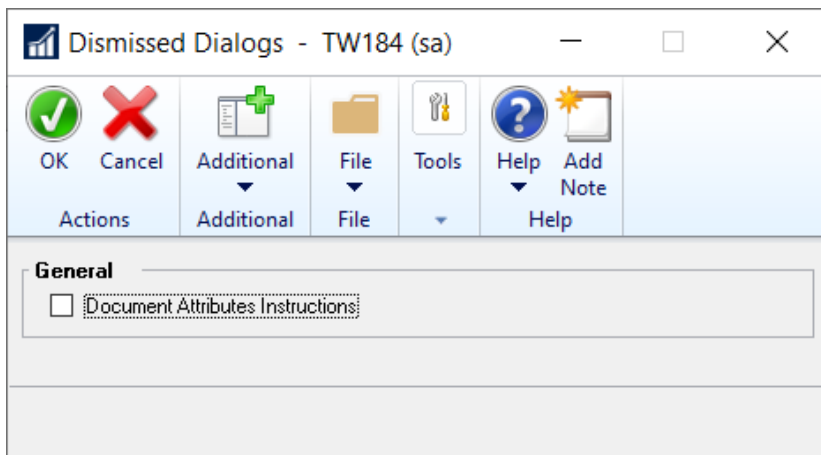

Archive and Purge

The Rockton Pricing Management Table Archive/Purge window allows you to archive and purge the Batch Recalc messages you receive after you run the RPM – Recalculate Batch process. Access this window from the Rockton Pricing Management Setup window.

Dismissed Dialogs

The Dismissed Dialogs window allows you to redisplay dialog messages that have been dismissed previously. If you receive a message regarding Document Attribute Instructions and mark the box to dismiss the message in the future, you can use this window to have the message display again. You may access this window under Microsoft Dynamics GP | Tools | Setup | Rockton Pricing Management | Dismissed Dialogs.

Note: The messages are dismissed by User, so changes to these settings will only affect the user making the change, not all users.
