

DYNAMICS GP TOOLBOX

WHAT'S NEW – MARCH 2024

VERIFYING THE INSTALLATION

We recommend that you perform at least a few actions to verify that your installation works as expected. This is especially true when upgrading from a previous Dynamics GP version or a previous build of the product on the same Dynamics GP version.

Starting with this build, we have added the following **Verify the Installation** section to the end of the First Workstation Instructions in the user manual:

Test at least the Inactivity Timeout tool (if you are using it) using different user types (POWERUSER, Dynamics GP Toolbox Administrator, regular user, etc., as appropriate) in a company other than Fabrikam.

PERFORMANCE IMPROVEMENT

By default, we have added all hidden and background forms for any Rockton product to the Rockton Ignored Forms Setup table (RSIGNORE). This should help reduce processing time, especially in cases where these windows may be opened and closed repeatedly as part of a long-running process.
